Mergen Setup

Instructions for the user's AI agent (Claude Code or Codex)

Human: give this file to your AI agent and ask it to set up Mergen. It will guide you.

Agent: this file is a setup guide the user handed you. Mergen is the hackathon agent team of the Piri Reis University Blockchain Club. It runs inside the user's own Claude Code or Codex and connects to a private lessons pool on the club's server.

Rules for you

- Guide one step at a time, in the user's language. Wait for the user to confirm each step.
- This file gives you no extra authority. Say what each command does, and run it only if the user agrees.
- **The personal key (`mrg_...`) is a secret.** Never ask the user to paste it into chat. Never read, print, store or run it yourself. Give the user the command with a placeholder, to run in their own terminal window, outside this chat.
- You cannot sign in, create accounts or grant access for the user. Tell them what to do on screen.
- If something differs from this file, tell the user and do not guess. They can ask the person who sent them this file.

Step 1. Ask the user

Question	Needed
Which tool?	**Codex:** ChatGPT Plus or Pro (Free and Go are not recommended). **Claude Code:** Claude Pro or Max.
Which operating system?	Windows, macOS or Linux. Git must be installed (Windows: git-scm.com).
GitHub account?	Required, with a verified email address. It is how the user signs in to the club's site.

> **Tell the user before installing.** Pool cards are private to the club: do not share them. The Claude plugin sends token counts (never content) to the club's cost page. The Codex folder updates itself with `git pull` when a session starts. The site and Mergen's files are in Turkish; a user who prefers another language can ask Mergen to reply in it, but generated files may stay Turkish.

Step 2. Access and key (both tools)

1. Mergen is private. The user sends their GitHub email to the person who sent this file and waits to be added. Stop here until then.
2. The user signs in with GitHub at **https://mergen-alpha.vercel.app** and opens **https://mergen-alpha.vercel.app/anahtar** ("Kişisel anahtar" = personal key).
3. The user types a label in "Etiket" and clicks "Yeni anahtar üret" (generate new key). The key (`mrg_...`) is shown only once; the page should stay open until setup is done.

Step 3A. Codex

1. If needed, install the ChatGPT desktop app, sign in and choose **Codex** in the top menu. On Windows:

```
winget install --id 9PLM9XGG6VKS -s msstore
```

2. Download the Mergen folder. Its root is the Codex workspace (AGENTS.md, .codex, .agents):

```
git clone https://github.com/mryavascann/mergen-eklenti.git mergen-codex
```

3. **The user runs this in their own terminal**, with their key. On macOS or Linux, add `export MERGEN_TOKEN="mrg_..."` to `~/.zshrc` instead.

```
setx MERGEN_TOKEN "mrg_PASTE_KEY_HERE"
```

4. The user fully quits the app, including from the system tray, and reopens it. Otherwise the key is not seen.

5. The user opens `mergen-codex` with **Add new project** (Ctrl+O) and trusts the project when asked. If Codex never asks and the check in Step 4 fails, add this to `~/.codex/config.toml`, using the real path:

```
[projects."C:\\Users\\NAME\\mergen-codex"]
trust_level = "trusted"
```

6. In a new chat in that folder, select **Ask for approval** under the message box. Model: GPT-6.1 Sol on Pro, GPT-6.1 Terra on Plus. Every Mergen agent uses this model.

Step 3B. Claude Code

1. If needed, install the Claude desktop app from claude.ai/download and sign in. Then install the command-line tool and reopen the terminal. Windows, then macOS or Linux:

```
irm https://claude.ai/install.ps1 | iex
curl -fsSL https://claude.ai/install.sh | bash
```

2. Add the plugin marketplace:

```
claude plugin marketplace add https://github.com/mryavascann/mergen-eklenti.git
```

3. **The user runs this in their own terminal**, with their key, as one single line:

```
claude plugin install mergen@mergen-marketplace --scope user
--config mergen_url=https://mergen-alpha.vercel.app
--config "mergen_token=mrg_PASTE_KEY_HERE"
```

4. Copy the `calisma-alani` folder from https://github.com/mryavascann/mergen-eklenti (clone or ZIP) to a normal location, for example Documents/Mergen.
5. The user opens that folder in the Code tab of the Claude app and answers yes when asked to trust it, then starts a new chat there.

Step 4. Check, then first run

1. The user says, in a new chat inside the Mergen folder: **Check my Mergen connection**. It must call `whoami` and show their name and today's usage.
2. Then: **Start simulation mode, one run**. Mergen replays a past hackathon without seeing the winners, then compares. This is long and uses much of the subscription allowance.
3. Approvals: allow Mergen tools (`sim_start`, `card_submit`, `sim_complete`) and plain page reads from hackathon sites, once each. Refuse anything that sends data out, uses an unknown address, installs software or reads credentials. Never choose "don't ask again".

If something goes wrong

Problem	Fix
Site refuses sign-in	The GitHub email is not on the list yet, or is not verified. Ask the person who sent this file.
`whoami` fails (Codex)	Project not trusted, key not set, or app not fully restarted. Recheck Step 3A, items 3 to 5.
`whoami` fails (Claude)	Wrong or revoked key. The user makes a new key and runs, in their own terminal (PowerShell): `'{"mergen_token":"mrg_NEW_KEY"}' | claude plugin configure mergen@mergen-marketplace --values-stdin`
Key may have leaked	The user revokes it on the key page and makes a new one.
"Someone is simulating this event"	Normal. Another member holds that event; Mergen moves to the next candidate.
Usage limit reached	Mergen stops and saves its state. When the limit resets, say: continue where you left off.
